Qingyun Hu-Yang is an independent philosopher and the founder of Harmondeg Philosophy, an original ontological framework that seeks to reconstruct the first principles of philosophy and establish a new foundation for understanding existence, life, knowledge, consciousness, human civilisation, and their future development.

His research is centred on ontology and extends systematically into comparative philosophy, philosophy of psychology, systems philosophy, philosophy of artificial intelligence, philosophy of science, ethics, technology governance, and civilisational studies. Rather than treating these as independent disciplines, his work develops them from a unified ontological foundation intended to connect philosophical inquiry with practical human concerns.

His published and forthcoming books include Harmondeg Philosophy: Principles of Ontology, Deconstructing Western Philosophy and Thought Systems, The Meta-Meaning of Life: Principles of Harmondeg Philosophy, Harmondeg Psychology: A New Paradigm for Psychology and Psychological Well-Being, together with book-length studies on systems philosophy, artificial intelligence, the value and nature of philosophy, and the future development of human civilisation. These works represent different applications of a single ontological framework rather than separate research projects.

His current research focuses on reconstructing philosophy as a practical foundational discipline capable of providing coherent first principles for science, psychology, artificial intelligence, ethics, governance, and interdisciplinary inquiry. A central objective of this work is to develop philosophical foundations that can contribute to the long-term flourishing of humanity and the emergence of a sustainable technological and spacefaring civilisation.

He is the founder of the Harmondeg Institute for Philosophy & Practice, an independent research institute dedicated to the theoretical development and interdisciplinary application of Harmondeg Philosophy.
