Dissertation: *Actual Causation: Apt Causal Models and Causal Relativism*
Committee: David Papineau (supervisor), Stephen Neale, Graham Priest,
Jonathan Schaffer (Rutgers), Michael Strevens (NYU)

Abstract: The philosophy of causation has been recently galvanized by what might be done with *structural equation models* – formal models that effectively link up correlational information with causal information. The success of these models for causal discovery suggests they could serve in an analysis of what causation *is*. But attempts to analyze actual causation in such terms largely bracket the question of what makes a model appropriate or *apt*. My dissertation provides this needed account of aptness, uncovering something surprising in the process: these models represent situations *only* relative to some set of background possibilities. As they stand, accounts of actual causation in the literature existentially quantify over all such sets. But this delivers previously unrecognized counterintuitive causal verdicts. As an alternative, I propose and defend the view that takes this relativity at face value – *Causal Relativism* – whereby actual causation is a three-part relation holding between a cause, an effect, and a set of background possibilities.
